Let's Start!

Getting Acquainted with PHP Data Types

Learning Outcome:

Understand information about common solutions to problems in spoken or written documents.
Talk about programming and data base related to hypertext preprocessor in spoken or written documents.

Can Do Statements:

- I can identify data types in PHP.
- I can give detailed information about data types in PHP.
- I can list data types.

Ask your partner:

- Have you worked with PHP before?
How does it work?
- What important functions do you think PHP has to operate when typing a script?

Let's Explore!

John is learning about data types in PHP.

Instructions: Read the text below.

- Calvin:** Hey John, what are you doing?
John: I'm just studying for a test. How are you?
Calvin: Well, I can't complain. How's the course going?
John: I'm very happy I took this course about PHP. I was thinking that PHP is easier than Java and also many big companies prefer to use it.
Calvin: That's true. Many well-known businesses work with PHP. You'll be working in one of them someday. If I had studied about PHP earlier, I would have obtained better jobs. There's a lot of jobs out there, so finding one is like shooting fish in a barrel.
John: I know!
Calvin: There are some things you have to know to master PHP, though. If I had known this before, I would have studied them in depth. For example, PHP supports different types of data.
John: Exactly, today we studied strings.
Calvin: That's the first type. The advantage of strings is that they can be as long or short as you want. Have you studied integers?
John: Not yet, but I would like to know about it.
Calvin: An integer is a data type that includes non-decimal numbers; these numbers are positive or negative and don't need a quotation mark. You just have to type them in the value.
John: There's another one that the teacher mentioned today, but I don't remember the name; it starts with an "A".
Calvin: Arrays?
John: That's it! I was nervous because she was asking some partners about it.
Calvin: Ha-ha! Well, if your teacher had asked you to talk about arrays, you would have mentioned that they work with multiple values. You know, they're going to be very useful when you need to arrange elements in a list. On the other hand, we also have floats; they hold a number and a decimal point.
John: I guess I'm going to have trouble remembering every single name.
Calvin: Don't worry! It's a piece of cake. A good piece of advice is to try to use mnemonic techniques; it works a treat. I would have memorized all these names if I had known this technique in the past.

Let's Practice!

Mentioning Types of Data

Instructions: Proofread the sentences. Correct the mistakes.

1. I will be take a course on PHP next year. I consider it's necessary for my career as a web developer.
2. I was think that the best data type is strings since you can type long scripts.
3. I will be reading about integer data type right now. An integer is a data type that includes non-decimal numbers; these numbers are positive or negative and don't need a quotation mark.
4. You will being studying about arrays next semester. This function will allow you to work with multiple values.
5. She is also studying about data types yesterday. She studied about arrays, strings, integers, and floats.

Let's Practice!

PHP Data Types Characteristics

Instructions: Select the correct answer.

1. If you had read about PHP data types, you would have known that some of them are _____.
 - a. strings, integer, float, and arrays
 - b. non-decimal, integer, and decimal
 - c. integer, float, floating point, and decimal
 - d. none of above
2. If you had chosen the strings data type, you would have had to work with _____.
 - a. non-decimal numbers
 - b. a sequence of characters
 - c. a floating point
 - d. multiple values
3. You would have worked with the integer data type if you had used _____.
 - a. a floating point
 - b. multiple values
 - c. non-decimal numbers
 - d. decimal numbers
4. If your teacher had asked you to talk about arrays, you would have mentioned that _____.
 - a. they don't work with multiple values
 - b. they work with floating numbers
 - c. they work with multiple values
 - d. they are not data types

Extension Activity

Let's share what we know about data types.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for different data types on PHP.
- Take notes about the information you found.
- Create a comparative chart where you explain the advantages and disadvantages of each data type on PHP.
- Use the grammar and vocabulary you studied in this learning object.
- Present your comparative chart in front of your class.

Target Words

- integer** (noun): a whole number that can be represented as negative, positive or zero; it is never a fractional number
e.g. An integer is a data type that includes non-decimal numbers; these numbers are positive or negative and don't need a quotation mark.
- Listen array** (noun): data type that assembles elements or values to be executed by a program
e.g. If your teacher had asked you to talk about arrays, you would have mentioned that they work with multiple values.
- Listen float** (noun): data type that has a single-precision 32-bit IEEE 754 floating point. It doesn't require a precise accuracy, so it can be used to store applications with large numbers
e.g. We also have floats; they hold a number and a decimal point.

Self-Assessment

- I understand what data types on PHP are.
- I identify differences among data types.
- I make a comparative chart explaining the advantages and disadvantages of each data type.
- I use the grammar and vocabulary I learned.
- I talk about data types on PHP to my classmates and teacher.

Yes

No

☐	☐

- PHP** (noun): (Hypertext Preprocessor) it refers to a scripting language that allows you to create web pages in an interactive way. It was developed by Rasmus Lerdorf in 1994
e.g. For example, PHP supports different types of data.
- Listen Java** (noun): programming language that was designed with the purpose of using a few number of implementation dependencies
e.g. I was thinking that PHP is easier than Java and also many big companies prefer to use it.
- Listen master** (verb): to learn how to do something perfectly
e.g. There are some things you have to know to master PHP, though.

Learning Points

Past, Present, and Future Continuous Review

We use statements in different tenses to talk about experiences in our lives.

The present continuous tense: Remember that we use the present continuous tense to talk about actions that are currently happening.

Grammatical structure:

Subject + **auxiliary verb to be** + **main verb (-ing form)** + complement

Examples:

*I **am trying** to understand the difference between PHP data types.*

*She **is studying** the different PHP data types.*

The past continuous tense: We use the past continuous tense to talk about actions that started in the past and were in progress until something stopped them.

Grammatical structure:

Subject + **auxiliary verb to be in past** + **main verb (-ing form)** + complement

Example:

*People **were having** problems creating dynamic content before the creation of PHP.*

The future continuous tense: We use the future continuous tense to talk about actions that will start and have a continuity in the future.

Grammatical structure:

Subject + **will** + **be** + **main verb (-ing form)** + complement

Example:

*Web designers **will be applying** upgrades on PHP in the years to come.*

Examples

- *I'm just studying for a test. How are you?*
- *I was thinking that PHP is easier than Java and also many big companies prefer to use it.*
- *You'll be working in one of them someday.*

Learning Points

The Third Conditional in Affirmative

You use **the third conditional** or “unreal past” to talk about situations that never happened and the possible results of said situations.

The **third conditional** is useful when we want to speculate about situations that could have been possible if something else had occurred. There are two ways to build this kind of statements:

1. Beginning with an if clause:

If + subject + **had** + **main verb in past participle** + complement + comma (,) + subject + **would have** + **main verb in past participle** + complement

Example:

*If I **had learned** about PHP in high school, I **would have chosen** to be a systems engineer.*

2. Beginning with the result clause (no need to add a comma):

Subject + **would have** + **main verb in past participle** + complement + if + subject + **had** + **main verb in past participle** + complement

Example:

*I **would have chosen** to be a systems engineer **If I had learned** about PHP in high school.*

Examples

- *If I had studied about PHP earlier, I would have obtained better jobs.*
- *There are some things you have to know to master PHP, though. If I had known this before, I would have studied them in depth.*
- *If your teacher had asked you to talk about arrays, you would have mentioned that they work with multiple values.*
