Let's Start!

PHP is making our job easier!

Learning Outcome:

Understand information about common solutions to problems in spoken or written documents.
Talk about programming and data base related to hypertext preprocessor in spoken or written documents.

Can Do Statements:

- I can explain what PHP is.
- I can give detailed information related to PHP
- I can identify features related to PHP.

Ask your partner:

- Which do you think is the best scripting language you know? Why?
- Based on your experience, what makes a programming language good?

Let's Explore!

Let's review what we know about PHP together. shall we?

Instructions: Read the text below.

- Juan:** Hello, Gabriel! What are you doing?
- Gabriel:** Hi! I'm reviewing my notes about PHP but they weren't written very clearly. I must have been somewhat heedless during class.
- Juan:** Oh! Let me help you! Let's review PHP together.
- Gabriel:** Great, thanks!
- Juan:** The basics should be covered first. What's PHP?
- Gabriel:** It was defined in the classroom as an open-source scripting language; PHP stands for Hypertext Processor. But the definition of open-source was not explained in class.
- Juan:** Open-source software is software that can be obtained for free and is made available to anyone.
- Gabriel:** Thanks! I may have taken some additional notes, let me see... Okay, PHP has been widely adopted because of its great compatibility; using this powerful language, HTML, CSS, JavaScript, and plain text can be integrated in a single platform. This wide compatibility must have been revolutionary in programming!
- Juan:** I'm sure it was! No wonder it's so popular these days. You know that the cloud will be the future of data storage and movement, and the code used by PHP is executed directly on the server. I'm sure this language will be used by everyone in the future!
- Gabriel:** This is the first programming language I have studied, and I cannot imagine how difficult it may have been to create dynamic content without it. PHP was created in 1994 by Rasmus Lerdorf; before then, web programming must have been a real brain-teaser.
- Juan:** Yes! The current popularity of web programming as a career may have been the result of the versatility and flexibility of PHP. The process of designing a website was simplified a lot with it! PHP can be executed on virtually any OS, any server type you can come across, and the format of your input ranges from plain text to HTML, to even Flash movies! You may have heard of PHP 7.1, which is its last iteration; it was released in December 2016 and will be supported until around 2020.
- Gabriel:** Yes! That's the one being discussed in the course. PHP must have changed a lot since it was released back in the 90s!

Let's Practice!

Okay, review is over! Let's see what you learned about PHP.

Instructions: Read the text and underline all phrases in passive voice.

Rasmus Lerdorf is the creator of PHP; it was made public in 1994. Before this scripting language was released, programming dynamic content for websites was very complicated. PHP has a couple of great advantages: first, it can be executed in any Operating System; and second, lots of media formats can be integrated in its code; this flexibility ranges from plain text to videos in formats like Flash. Although it sounds like a billion-dollar idea, all PHP iterations have been released as open-source software; this alone might be its greatest advantage! PHP has been in use for over 20 years, and it will continue to be used for many years to come!

Let's Practice!

The field of web programming would be so different without PHP...

Instructions: Proofread the sentences. Correct the mistakes. Read the sentences aloud. Check your pronunciation with your instructor.

1. Before PHP was released, integrating PDF files in websites may has been quite complicated.
2. It may had take very long to put together thousands of code lines and plain text.
3. Web programming may has become a quite popular job after PHP was released.
4. There must not have been an easy way to compile so many different formats in a single language.
5. A scripting language executed directly on the server could have been an impossibility before PHP was available.

Extension Activity

Now that you know the very basics of PHP, let's dig into it a little deeper.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for additional information on how different data formats are integrated into PHP.
- Create a presentation with a visual aid (it may be a mind map, a concept map, a diagram, etc) in which you explain your findings
- Present your work to your peers and instructor, and ask for their feedback or additional information to complement your presentation.

Self-Assessment

Yes

No

- I research for external sources of information about the functionalities of PHP.
- I write and compile my findings in a coherent and purposeful manner.
- I present my findings to share my knowledge with my peers.

Target Words

- versatility** (noun): the ability or capacity to change and adapt easily to different circumstances
e.g. The current popularity of web programming as a career may have been the result of the versatility and flexibility of PHP.
- iteration** (idiom): the continuous process of improvement and publication of a product
e.g. You may have heard of PHP 7.1, which is its last iteration; it was released on December 2016, and will be supported until around 2020.
- plain text** (noun): In computing, plain text is text that has no format
e.g. Using this language, HTML, CSS, JavaScript, and plain text can be integrated in a single platform.

- somewhat** (adverb): o some degree; similar in meaning to, but more formal than "a bit"
e.g. I must have been somewhat heedless during class.
- heedless** (adjective): not paying attention to one's surroundings
e.g. I must have been somewhat heedless during class.
- brain-teaser** (noun): expression a problem very complicated to work out
e.g. PHP was created in 1994 by Rasmus Lerdorf; before then, web programming must have been a real brain-teaser.

Learning Points

Modals for Speculating in the Past

Modal verbs express different degrees of a possibility, ability, or necessity. **Speculation** of past events refers to the consideration of possibilities that did not materialize.

At this point, you're already familiar with **modal verbs** and some of their common uses. Now, we will learn how to use them to **speculate about past events**. We will focus on three modal verbs frequently used for this purpose: **should**, **could**, **must** and **may**.

A **speculation** is a consideration of different possibilities in regards to an action or an event. Let's take a look at this scenario:

Person A: "The president of the company is not picking up the phone."

Person B: "He **may** still be in the meeting."

Person A provides a situation, and person B is **speculating**, or considering, one of the possible reasons for that situation. This example is expressed in the present tense. Now, let's focus on **speculations about past events**.

All past actions and events we speculate about are **finished**; that's why we use **perfect tenses** and **past participle forms** of the verbs. The basic structure for a speculation about the past is:

Subject + **Modal verb** + **Have (perfect tense auxiliary)** + **Main verb (in past participle form)** + Complement

Examples:

Person A: "This website is horribly programmed."

Person B: "Its programmers **may have been** in a hurry when they put it together."

Person C: "But, the software engineers were awarded with a quality bonus; **they must have done** a perfect job this year!"

As you can see, **must** and **may** have virtually the same meaning in the context of **speculation about past events**, as they both express a guess from the speaker. The modal verb **should**, however, is used to provide an opinion of what would have been a better alternative to the past action.

Example:

Person A: "I failed the final programming exam!"

Person B: "**You should have reviewed** the PHP video I sent you."

Person B knows that Person A did not review the video, and that **may have helped** Person A to pass the exam.

Past, Present, and Future in Passive Form

The passive voice is useful when we want to talk about actions or events and we want to focus on them, instead of focusing on who performed or caused them.

The **passive voice** is useful when we want to:

- Change the focus of the sentence.
- Avoid mentioning the performer of the action because it is not important, or it's unknown.
- Provide a sense of impersonality to a formal document (such as a research paper).

The verb *to be* is very important in the **passive voice**. Sometimes, however, it can be substituted by the verb *get*.

Now, we will review the forms of the passive voice, depending on the tense in which it is used.

Passive Voice in Past Tenses

The most common use of the **passive voice** in past is the expression of dates and authors of creations (books, machines, theories, etc.); this is done in **past simple**:

Active voice: *Sir Isaac Newton proposed the theory of Universal Gravitation.*

Passive voice: *The theory of Universal Gravitation **was proposed by** Sir Isaac Newton.*

Of course, the **passive voice** can be used in any other form of past, and it can get quite complex; let's take a look at the following chart to see some examples:

Learning Points

Active voice	Passive Voice
<i>The boss promoted Eliana to Vice president.</i>	<i>Eliana was promoted to Vice president (by the boss).</i>
<i>Eliana was programming a website using PHP.</i>	<i>A website was being programmed(by Eliana) using PHP.</i>
<i>Juan had been designing a new programming language based on PHP.</i>	<i>A new programming language based on PHP had been being designed (by Juan)</i>
<i>Juan had written more than 1,000 lines of code.</i>	<i>More than 1,000 lines of code had been written (by Juan).</i>

(The words in parentheses in the chart are optional, as they refer to the performer of the action)

Passive Voice in Present Tenses

Again, the **passive voice** is very useful in this tense, and it can be used in any form, whenever the performer of the action is not relevant.

Active Voice	Passive Voice
<i>We use PHP every day at the office.</i>	<i>PHP is used every day at the office (by us).</i>
<i>We are using PHP to design websites more easily.</i>	<i>PHP is being used to design websites more easily.</i>
<i>The company has implemented PHP as standard in all branches.</i>	<i>PHP has been implemented as standard in all branches (by the company).</i>

Passive Voice in Future Tenses

Some of the common uses of the **passive voice in future tenses** is the assignment of deadlines, warning of future changes in procedures, and reporting of future events. Using the **passive voice** in contexts like these provides a degree of formality and impersonality: what matters is the action/event, not who will do it.
