### Let's Start!

PHP is an awesome code language.

### Learning Outcome:

Understand information about common solutions to problems in spoken or written documents.  
Talk about programming and data base related to hypertext preprocessor in spoken or written documents.

### Can Do Statements:

- I can talk about both, syntax and variables in PHP.
- I can explain what a comment is in PHP.
- I can identify some PHP variables.

### Ask your partner:

- If you were to create your own scripting language, what characteristics would it have?
- Do you know any differences between PHP and other programming languages? Which one?

## Let's Explore!

Christian could be a great teacher!

*Instructions: Read the text below.*

- Amy:** Hi, Christian. What are you doing?
- Christian:** Hi! Well, yesterday my brother asked me if I knew what PHP was, and I realized that I forgot some concepts about it. For this reason, I'm practicing and watching this video online.
- Amy:** Great! So, we can watch it together, and you can explain to me what happens in PHP; I still have trouble understanding what syntax is, can you show me?
- Christian:** Okay. Take a look at this example of PHP syntax: PHP is being executed on the server. As you can see, all PHP codes start with brackets and are also followed by a question mark. They finish with a question mark and a bracket. The order is not interchangeable, and the file extension is .php.
- Amy:** Last class, Susie asked me if I knew what syntax and variables in PHP were. Do you know what they are?
- Christian:** Good question. As you can observe, a PHP script is being executed on the server, and the plain HTML result is being sent back to the browser. As far as variables go, you can think of them as containers to store information. They have to be followed by the name of the variable. In other computer programming languages, such as Java, there is a command to declare a variable. On the other hand, in PHP you create a variable when you assign a value to it. Every time you assign a value to a variable, you should put it in quotation marks. Global and Local are examples of some variables in PHP.
- Amy:** And, what is a comment?
- Christian:** Commenting is like a note for yourself or for other programmers. It doesn't show up on the webpage. Once in the middle of a class, the teacher asked us if we saw the similarity between PHP and magic tricks; no one understood until he said that, in both cases, you only show to others what you want. Anyways, always try to comment a lot so you don't forget what you're doing with your code.
- Amy:** Finally, how can I identify some PHP variables?
- Christian:** Well, variables are like containers for information; they must start with the dollar sign and then a letter or underscore mark. So, if you see those elements in a code, that's definitely a variable.

## Let's Practice!

What is happening at this moment?

*Instructions: Read the text again. Circle the correct words to complete the sentence.*

1. That PHP code is (being started / being starting / being start) with brackets.

\_\_\_\_\_

2. A question mark is (being wrote / being written/being write) after the code.

\_\_\_\_\_

3. Variables (are / is / be) being followed by quotation marks.

\_\_\_\_\_

4. A PHP script is (being executing / being executed / being execute) on the server.

\_\_\_\_\_

5. The plain HTML result is (being send / being sent / being sending) back to the browser.

\_\_\_\_\_

## Let's Practice!

Amy has learned everything very well.

*Instructions: Read the sentences. Write the missing word in the blank. Use: what programmers, what I needed, what you were, what, what I wanted. Practice saying the sentences aloud. Check your pronunciation with your instructor.*

1. I didn't know \_\_\_\_\_ a comment was.

2. I realized that notes were \_\_\_\_\_ wanted to see in each comment.

3. \_\_\_\_\_ to know was how to write a comment in PHP.

4. \_\_\_\_\_ to know was where to show up my comments.

5. He asked me \_\_\_\_\_ doing with your code.

### Extension Activity

Have you ever worked in PHP?

*Instructions: Complete the following steps. Fill in the Self-Assessment.*

- Look for further information on syntax and variables in PHP.
- Take notes about the information you are reading.
- Write three paragraphs to explain how syntax and variables work in PHP. Include examples.
- Use What clauses, and passive of present continuous in your sentences.
- Share your text with your partners.

#### Self-Assessment

Yes

No

- I search information about syntax and variables in PHP
- I write a text to explain how syntax and variables work in PHP using examples.
- I share summarized information with my partners.

☐☐☐☐☐☐

### Target Words

- **command** (noun): a directive; an instruction or order to a computer program  
e.g. In other computer programming languages, such as Java, there is a command to declare a variable.
- **file** (noun): program records stored by name  
e.g. The file extension is .PHP.
- **to show up** (phrasal verb): to appear; to pop up; to be seen  
e.g. It doesn't show up on the webpage.
- **execute** (verb): to carry out an order; to perform or do  
e.g. PHP is being executed on the server.
- **bracket** (noun): pair of marks used to enclose words  
e.g. All PHP codes start with brackets.
- **question mark** (noun): marks used in questions  
e.g. All PHP codes start with brackets and are also followed by a question mark

## Learning Points

### Reported Questions

We use **reported speech** to say what another person said or asked.

We use **reporting verbs** to say what another person said. If we are **reporting a question**, we don't need to use the structure of a question, but the structure of an affirmative sentence.

In a direct question, we use the verb before the subject. In a **reported question**, we change the order back to an affirmative sentence, so we use the verb after the subject.

Example:

**Direct question:** *what is PHP?*

**Reported question:** *she **asked** me what PHP **was**.*

As you can notice, we don't need any question mark. However, if we have to report a yes/no question, you need to add *if*.

Example:

**Direct question:** *Is this PHP?*

**Reported question:** *he **asked** me if this **was** PHP.*

### Examples

- *Well, yesterday my brother asked me if I knew what PHP was, and I realized that I forgot some concepts about it.*
- *Last class, Susie asked me if I knew what syntax and variables in PHP were.*
- *Once in the middle of a class, the teacher asked us if we saw the similarity between PHP and magic tricks; no one understood until he said that, in both cases, you only show to others what you want.*

## Learning Points

### Passive of Present Continuous

We use the **passive** of **present continuous** to talk about actions that are happening in the moment of speaking, but the emphasis of the sentence is on the object.

To use the **passive voice** in **present continuous**, it is not necessary to mention the subject or doer of the action, when the doer of the action is not important, or when we don't know who the doer of the action is.

Follow this structure to write sentences in **passive voice** in the **present continuous** tense:

Object + is/are + being + main verb in past participle

Example: A website is ***being designed***.

If you want to mention the subject or doer you can use this structure:

Object + is/are + being + main verb in past participle + by + subject.

Example: A website ***is being designed by me***.

### Examples

- *PHP is being executed on the server.*
- *As you can observe, a PHP script is being executed on the server, and the plain HTML result is being sent back to the browser.*
