Let's Start!

We will explore some facts about HTML.

Learning Outcome:

Understand information about common solutions to problems in spoken or written documents.

Describe concepts, principles, and important characteristics of hypertext preprocessor in spoken or written documents.

Can Do Statements:

- I can explain what HTML is.
- I can give detailed information about HTML.
- I can talk briefly about the history of HTML

Ask your partner:

- Why is HTML so important for the creation of websites?
- What do you know about website creation? How do you think a website is built?

Let's Explore!

Albert and Robert share ideas about HTML.

Instructions: Read the text below.

- Albert:** As I was told that HTML was a great option for designing websites, I started delving into the subject and I figured out there's a lot that needs to be learned.
- Robert:** There is indeed. So, you use HTML for designing webpages as it is a standard markup language, don't you?
- Albert:** That's right. That's the reason why HTML stands for Hyper Text Markup Language. You know what this refers to, don't you?
- were created as the various web pages needed to be associated and linked together in order to make the sharing of information easier. On the other hand, I believe markup language was introduced to mark up text documents with tags so that the web browser could know how to structure the information. I understand that HTML basically defines the structure of documents such as headings and paragraphs in order to make the creation of a web page easier. I understand a defined structure needs to be entered, doesn't it?
- Albert:** Undoubtedly. You know quite a lot. Let's not forget that the documents need to be formatted by using HTML tags, which describe the content of the document. Most HTML tags need both an opening and a closing tag to indicate where a specific format starts and where it ends.
- Robert:** You work with the HTML-5 version, don't you?
- Albert:** Yes! I've tried other versions too, though. I read a little bit about its history and learned that HTML was first created in 1992 but it was the HTML 2.0 version that was considered to have standardized specifications. Later on, the HTML 4.01 version was released in 1999 and it was then modified into the HTML-5 version which was published in 2012.

**Let's Practice!**

This is HTML

Instructions: Find the missing words for each sentence.

1. We have to codify the text using M _ _ _ _ _ l _ _ _ _ _ , don't we?
2. The links that appear on the web page are called h _ _ _ _ _ , aren't they?
3. HTML s _ _ _ _ s f _ _ _ _ _ hypertext markup language, doesn't it?
4. We're using the t _ _ _ _ s to format the content, aren't we?
5. HTML help us to f _ _ _ _ _ web pages using tags, doesn't it?
6. W _ _ _ s _ _ _ _ are also called HTML documents, aren't they?

**Let's Practice!**

Use HTML

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: needs to be used, needs to be used, needs to be added, needs to be implemented, need to be presented

1. Every single tag _____ carefully to actually see the changes.
2. Markup language _____ in HTML so a document is annotated in a way which is syntactically distinguishable from regular text.
3. Elements in HTML web pages _____ through hypertext so you can easily go to another document.
4. HTML _____ all the time in the design of a website text format.
5. HTML language _____ in the design of a website structure.

Extension Activity

HTML rules!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Research more on HTML.
- Make your own HTML document.
- Write a text expressing the advantages and disadvantages when using HTML for web design.

Self-Assessment

Yes

No

- I research on HTML.
- I talk about the things I can do with HTML.
- I explain my partners how HTML works.
- I write a text about HTML.

☐	☐

☐	☐
☐	☐

Target Words

- **markup language** (noun): it is a system of codes that is distinguishable from the text and gives information about the format.
e.g. I believe this markup language was introduced to mark up text documents with tags so that the web browser could know how to structure the information.
- **hypertext** (noun): it is a text that is referenced to another text by a hyperlink.
e.g. Hypertexts were created as the various web pages needed to be associated and linked together in order to make the sharing of information easier.
- **undoubtedly** (adverb): without any doubt, certainly.
e.g. Undoubtedly. You know quite a lot.
- **format** (verb): to arrange something in a specific form.
e.g. Most HTML tags need both an opening and a closing tag to indicate where a specific format starts and where it ends.
- **delve into something** (idiom): research on something, investigate about something.
e.g. As I was told that HTML was a great option for designing websites, I started delving into the subject and I figured out there's a lot that needs to be learned.
- **stand for** (phrasal verb): to mean or refer to something that is abbreviated by letters or symbols.
e.g. That's the reason why HTML stands for Hyper Text Markup Language.

Learning Points

Tag Questions with Do or Does

We use **tag questions** when we want to confirm a previous statement. In this learning point, we are going to review some few important things to consider when using tag questions.

When using **tag questions**, we choose a specific verb and pronoun depending on the statement we want to confirm.

If the statement's main verb is in *simple present tense*, then, we use the auxiliary verbs **do** or **does**, according to the subject of the sentence to create the **tag question**, and we replace the subject for a subject pronoun.

Remember that the **tag question** is *negative* if the statement is *positive*, or *positive* if the statement is *negative*.

Examples:

You know a lot about HTML, don't you?

HTML helps you to create websites, doesn't it?

Camilo doesn't like HTML, does he?

Examples

- *So, you use HTML for designing webpages as it is a standard markup language, don't you?*
- *You know what this refers to, don't you?*
- *I understand a defined structure needs to be entered, doesn't it?*
- *You work with the HTML-5 version, don't you?*

Learning Points

Need + Passive Infinitive

We can use the verb **need** with a passive infinitive when we want to express something that has to be done.

When the verb **need** is used with a **passive infinitive** the doer or responsible for the action is not relevant or is understood.

The structure is the following:

Thing or person that receives the action + Verb **need** + **be** + **Past participle of the main verb**

Examples:

*The HTML manual **needs to be learned** by the students.*

*That website **needs to be adjusted** in accordance with the latest HTML version available.*

Notice that we can either express the agent that performs the action using the preposition **by**, but many times it is not necessary.

Examples

- *As I was told that HTML was a great option for designing websites, I started delving into the subject and I figured out there's a lot that **needs to be learned**.*
- *From what I know, hypertexts were created as the various web pages **needed to be associated and linked together** in order to make the sharing of information easier.*
- *Let's not forget that the documents **need to be formatted** by using HTML tags, which describe the content of the document.*

Learning Points

A Short List of Programming and Computer Science Terms

When learning and using software, we are going to encounter special terminology that has to be learned and understood. In this learning point we are going to take a look at 5 very useful software terms.

Tag: Tags are the format used for making a web page look the way it does. You can identify a tag as being surrounded by angle brackets:

Most tags come in pairs. For instance, if I want to write a headline I should introduce the headline tag at the beginning of the headline and a closing tag at the end of it:

Tape Library: A **tape library** is a storage device where tape drivers are kept. These tape libraries can store an immense amount of data from 20 terabytes to 2.1 exabytes of data.

Third Generation Language: A **third-generation programming language** is a general way of categorizing programming languages. This generation is more machine-independent and makes it easier to carry out the programming process.

Trial Software: A **trial software** is a computer software that can be used for a limited period of time with the purpose of letting the user know how the software works and if it suits their needs.

TrueSpace: **TrueSpace** is a 3D computer graphics and animation software that was developed by the Caligari Corporation.
